(a) Geomorphological map of 67P showing the types of terrains identified at the surface which include cliffs (dark blue), talus deposits (teal), bouldered plains (blue), mottled pit terrains (purple), smooth plains (light green), pitted plains (dark green), and cauliflower plains (yellow). There is an unmapped region (UM) due to shadows in available imagery. Figure modified from Figure 7 in Birch et al. (2017).

(b) Regions of the comet surface that are likely to expose less modified material. Top images are geomorphologic mapping units based on Rosetta imagery and bottom images are root mean squared (RMS) roughness maps. Figure modified from Figure 8 in Birch et al. (2017)
